#### 1.1 SUM OF INDEPENDANT RANDOM VARIABLES

Two dice, one blue and one grey, are thrown at the same time. The event defined by the sum of the two numbers appearing on the top of the dice can have 11 possible outcomes 2, 3, 4, 5, 6, 6, 8, 9, 10, 11 and 12. A student argues that each of these outcomes has a probability  $\frac{1}{11}$ . Do you agree with this argument? Justify your answer.

1.1.1 The Uniform Distribution: Let  $X_i \in \{1, 2, 3, 4, 5, 6\}, i = 1$ 1, 2, be the random variables representing the outcome for

$$p_{X_i}(n) = \Pr(X_i = n) = \begin{cases} \frac{1}{6} & 1 \le n \le 6\\ 0 & otherwise \end{cases}$$
 (1.1.1.1)

$$p_X(n) \neq \frac{1}{11} \tag{1.1.1.4}$$

$$p_X(n) = \frac{1}{6} \sum_{k=1}^{6} p_{X_1}(n-k) = \frac{1}{6} \sum_{k=n-6}^{n-1} p_{X_1}(k) \quad (1.1.2.5)$$

$$p_{X_1}(k) = 0, \quad k \le 1, k \ge 6.$$
 (1.1.2.6)

$$p_X(n) = \begin{cases} 0 & n < 1\\ \frac{1}{6} \sum_{k=1}^{n-1} p_{X_1}(k) & 1 \le n-1 \le 6\\ \frac{1}{6} \sum_{k=n-6}^{6} p_{X_1}(k) & 1 < n-6 \le 6\\ 0 & n > 12 \end{cases}$$
(1.1.2.7)

Substituting from (1.1.1.1) in (1.1.2.7),

$$p_X(n) = \begin{cases} 0 & n < 1\\ \frac{n-1}{36} & 2 \le n \le 7\\ \frac{13-n}{36} & 7 < n \le 12\\ 0 & n > 12 \end{cases}$$
 (1.1.2.8)

satisfying (1.1.1.4).

1.1.3 The Z-transform: The Z-transform of  $p_X(n)$  is defined as

$$P_X(z) = \sum_{n=-\infty}^{\infty} p_X(n) z^{-n}, \quad z \in \mathbb{C}$$
 (1.1.3.1)

From (1.1.1.1) and (1.1.3.1),

$$P_{X_1}(z) = P_{X_2}(z) = \frac{1}{6} \sum_{n=1}^{6} z^{-n}$$

$$= \frac{z^{-1} (1 - z^{-6})}{6 (1 - z^{-1})}, \quad |z| > 1 \quad (1.1.3.3)$$

upon summing up the geometric progression.

$$\therefore p_X(n) = p_{X_1}(n) * p_{X_2}(n), \tag{1.1.3.4}$$

$$P_X(z) = P_{X_1}(z)P_{X_2}(z) (1.1.3.5)$$

The above property follows from Fourier analysis and is fundamental to signal processing. From (1.1.3.3) and (1.1.3.5), 1.1.5 The python code is available in

$$P_X(z) = \left\{ \frac{z^{-1} \left( 1 - z^{-6} \right)}{6 \left( 1 - z^{-1} \right)} \right\}^2$$

$$= \frac{1}{36} \frac{z^{-2} \left( 1 - 2z^{-6} + z^{-12} \right)}{\left( 1 - z^{-1} \right)^2}$$
(1.1.3.6)

Using the fact that

$$p_X(n-k) \stackrel{\mathcal{H}}{\longleftrightarrow} ZP_X(z)z^{-k},$$
 (1.1.3.8)

$$nu(n) \stackrel{\mathcal{H}}{\longleftrightarrow} Z \frac{z^{-1}}{(1-z^{-1})^2}$$
 (1.1.3.9)

after some algebra, it can be shown that

$$\frac{1}{36} \left[ (n-1) u(n-1) - 2 (n-7) u(n-7) + (n-13) u(n-13) \right] 
\longleftrightarrow Z \frac{1}{36} \frac{z^{-2} \left( 1 - 2z^{-6} + z^{-12} \right)}{\left( 1 - z^{-1} \right)^2} \quad (1.1.3.10)$$

where

$$u(n) = \begin{cases} 1 & n \ge 0 \\ 0 & n < 0 \end{cases}$$
 (1.1.3.11)

From (1.1.3.1), (1.1.3.7) and (1.1.3.10)

$$p_X(n) = \frac{1}{36} \left[ (n-1) u(n-1) -2 (n-7) u(n-7) + (n-13) u(n-13) \right]$$
 (1.1.3.12)

which is the same as (1.1.2.8). Note that (1.1.2.8) can be obtained from (1.1.3.10) using contour integration as well.

1.1.4 The experiment of rolling the dice was simulated using Python for 10000 samples. These were generated using Python libraries for uniform distribution. The frequencies for each outcome were then used to compute the resulting pmf, which is plotted in Figure 1.1.4.1. The theoretical pmf obtained in (1.1.2.8) is plotted for comparison.

#### 2.1 Uniform Random Numbers

Let U be a uniform random variable between 0 and 1.

2.1.1 Generate  $10^6$  samples of U using a C program and save into a file called uni.dat.

**Solution:** Download the following files and execute the C program.

codes/include/coeffs.h codes/chapter2/uni\_gen\_stat.c

2.1.2 Load the uni.dat file into python and plot the empirical CDF of U using the samples in uni.dat. The CDF is defined as

$$F_U(x) = \Pr(U \le x)$$
 (2.1.2.1)

**Solution:** The following code plots Fig. 2.1.2.1 codes/chapter2/cdf\_plot\_uni.py

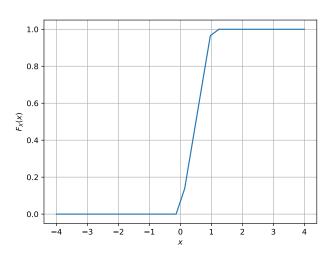

Fig. 2.1.2.1: The CDF of U

2.1.3 Find a theoretical expression for  $F_U(x)$ .

**Solution:** 

$$F_U(x) = \int_{-\infty}^x f_U(x) \, dx \tag{2.1.3.1}$$

For the uniform random variable U,  $f_U(x)$  is given by

$$f_U(x) = \begin{cases} 1 & 0 \le x \le 1\\ 0 & elsewhere \end{cases}$$
 (2.1.3.2)

Substituting (2.1.3.2) in (2.1.3.1),  $F_U(x)$  is found to be

$$F_U(x) = \begin{cases} 0 & x < 0 \\ x & 0 \le x \le 1 \\ 1 & x > 0 \end{cases}$$
 (2.1.3.3)

2.1.4 The mean of U is defined as

$$E[U] = \frac{1}{N} \sum_{i=1}^{N} U_i$$
 (2.1.4.1)

and its variance as

2.1.5 Verify your result theoretically given that

$$E\left[U^{k}\right] = \int_{-\infty}^{\infty} x^{k} dF_{U}(x) \tag{2.1.5.1}$$

**Solution:** For a random variable X, the mean  $\mu_X$  and variance  $\sigma_X^2$  are given by

$$\mu_X = E[X] = \int_{-\infty}^{\infty} x dF_U(x)$$
 (2.1.5.2)

$$\sigma_X^2 = E[X^2] - \mu_X^2 = \int_{-\infty}^{\infty} x^2 dF_U(x) - \mu_X^2$$
 (2.1.5.3)

Substituting the CDF of U from (2.1.3.3) in (2.1.5.2) and (2.1.5.3), we get

$$\mu_U = \frac{1}{2} \tag{2.1.5.4}$$

codes/include/coeffs.h codes/chapter2/gau\_gen\_stat.c

(2.1.3.1) 2.2.2 Load gau.dat in python and plot the empirical CDF of X using the samples in gau.dat. What properties does a CDF have?

$$p_X(x) = \frac{d}{dx} F_X(x) \tag{2.2.3.1}$$

What properties does the PDF have?

The properties of PDF are

$$f_X(x) \ge 0$$

repeat the above exercise theoretically.

**Solution:** Substituting the PDF from (2.2.5.1) in (2.1.5.2),

$$\mu_X = \int_{-\infty}^{\infty} \frac{x}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right) dx$$
(2.2.5.2)

Using

(2.2.5.3)

(2.2.5.5)

(2.2.5.10)

(2.2.5.11)

$$\int x \cdot \exp(-ax^2) dx = -\frac{1}{2a} \cdot \exp(-ax^2)$$

$$\mu_X = \frac{1}{\sqrt{2\pi}} \left[ -\exp\left(-\frac{x^2}{2}\right) \right]_{-\infty}^{\infty}$$
(2.2.5.4)

$$\mu_X = 0 \tag{2.2.5.6}$$

Substituting  $\mu_X$  and the PDF in (2.1.5.3) to compute vari-

$$\sigma_X^2 = \int_{-\infty}^{\infty} \frac{x^2}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right) dx \tag{2.2.5.7}$$

Substituting

$$t = \frac{x^2}{2},\tag{2.2.5.8}$$

$$\sigma_X^2 = \frac{2}{\sqrt{\pi}} \int_0^\infty t^{\frac{1}{2}} \exp\left(-t\right) dt$$
 (2.2.5.9) 2.4.1 Generate 
$$= \frac{2}{\sqrt{\pi}} \int_0^\infty t^{\frac{3}{2} - 1} \exp\left(-t\right) dt$$

Using the gamma function

$$\Gamma(x) = \int_0^\infty z^{x-1} \cdot e^{-z} dz$$

$$\sigma_X^2 = \frac{2}{\sqrt{\pi}} \Gamma(\frac{3}{2})$$

$$= \frac{2}{\sqrt{\pi}} \frac{\sqrt{\pi}}{2}$$

2.3 From Uniform to Other

$$V = -2\ln(1 - U) \tag{2.3.1.1}$$

and plot its CDF.

**Solution:** The samples for U are loaded from uni.dat file generated in problem 2.1.4. The CDF of V is plotted in Fig. 2.3.1.1 using the code below,

codes/chapter2/function\_1.py

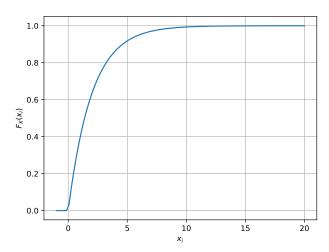

Fig. 2.3.1.1: The CDF of V

2.3.2 Find a theoretical expression for  $F_V(x)$ .

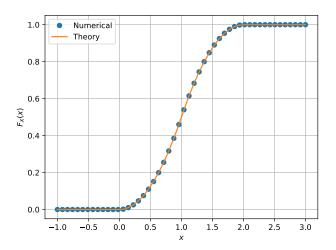

Fig. 2.4.2.1: The CDF of T

#### 2.4.3 Find the PDF of T.

**Solution:** The PDF of T is plotted in Fig. 2.4.3.1 using the code below

codes/chapter2/function\_2.py

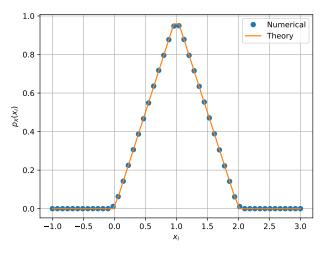

Fig. 2.4.3.1: The PDF of T

2.4.4 Find the theoretical expressions for the PDF and CDF of T. **Solution:** Since T is the sum of two independant random variables U1 and U2, the PDF of T is given by

$$p_T(x) = p_{U1}(x) * p_{U2}(x)$$
 (2.4.4.1)

Using the PDF of U from (2.1.3.2), the convolution results in

$$p_T(x) = \begin{cases} 0 & x < 0 \\ x & 0 \le x \le 1 \\ 2 - x & 1 \le x \le 2 \\ 0 & x > 2 \end{cases}$$

The CDF of T is found using (2.1.3.1) by replacing U with T. Evaluating the integral for the piecewise function  $p_T(x)$ ,

$$F_T(x) = \begin{cases} 0 & x < 0\\ \frac{x^2}{2} & 0 \le x \le 1\\ 2x - \frac{x^2}{2} - 1 & 1 \le x \le 2\\ 1 & x > 2 \end{cases}$$
 (2.4.4.3)

2.4.5 Verify your results through a plot.

Solution: The theoretical and numerical plots for the CDF and PDF of T closely match in Fig. 2.4.2.1 and Fig. 2.4.3.1

 (5.1.0.2)

#### Chapter 6 Exercises

#### 6.1 BPSK

6.1.1 The signal constellation diagram for BPSK is given by Fig. 6.1.1.1. The symbols  $s_0$  and  $s_1$  are equiprobable.  $\sqrt{E_b}$  is the energy transmitted per bit. Assuming a zero mean additive 6.1.6 Verify the bit error rate (BER) plots for BPSK through white gaussian noise (AWGN) with variance  $\frac{N_0}{2}$ , obtain the symbols that are received.

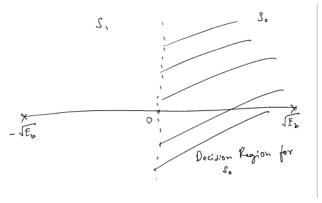

Fig. 6.1.1.1

**Solution:** The possible received symbols are

$$y|s_0 = \sqrt{E_b} + n (6.1.1.1)$$

$$y|s_1 = -\sqrt{E_b} + n (6.1.1.2)$$

where the AWGN  $n \sim \mathcal{N}\left(0, \frac{N_0}{2}\right)$ .

6.1.2 From Fig. 6.1.1.1 obtain a decision rule for BPSK

**Solution:** The decision rule is

$$y \underset{s_1}{\gtrless} 0$$
 (6.1.2.1)

- 6.1.3 Repeat the previous exercise using the MAP criterion.
- 6.1.4 Using the decision rule in Problem 6.1.2, obtain an expression for the probability of error for BPSK.

**Solution:** Since the symbols are equiprobable, it is sufficient if the error is calculated assuming that a 0 was sent. This results in

$$P_e = \Pr(y < 0|s_0) = \Pr(\sqrt{E_b} + n < 0)$$
 (6.1.4.1)

$$= \Pr\left(-n > \sqrt{E_b}\right) = \Pr\left(n > \sqrt{E_b}\right) \qquad (6.1.4.2)$$

since n has a symmetric pdf. Let  $w \sim \mathcal{N}(0,1)$ . Then n = $\sqrt{\frac{N_0}{2}}w$ . Substituting this in (6.1.4.2),

$$P_e = \Pr\left(\sqrt{\frac{N_0}{2}}w > \sqrt{E_b}\right) = \Pr\left(w > \sqrt{\frac{2E_b}{N_0}}\right)$$
(6.1.4.3)

$$=Q\left(\sqrt{\frac{2E_b}{N_0}}\right) \tag{6.1.4.4}$$

where  $Q(x) \triangleq \Pr(w > x), x \geq 0$ .

6.1.5 The PDF of  $w \sim \mathcal{N}(0,1)$  is given by

 (6.1.5.1)

and the complementary error function is defined as

simulation and analysis for 0 to 10 dB.

**Solution:** The following code

codes/bpsk\_ber.py yields Fig. 6.1.6.1

6.1.7 Show that

$$Q(x) = \frac{1}{\pi} \int_0^{\frac{\pi}{2}} e^{-\frac{x^2}{2\sin^2\theta}} d\theta$$
 (6.1.7.1)

#### 6.2 COHERENT BFSK

6.2.1 The signal constellation for binary frequency shift keying (BFSK) is given in Fig. 6.2.1.1. Obtain the equations for the received symbols.

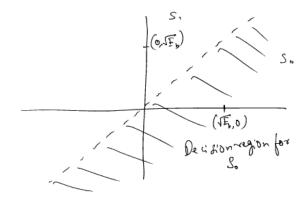

Fig. 6.2.1.1

Solution: The received symbols are given by

$$\mathbf{y}|s_0 = \begin{pmatrix} \sqrt{E_b} \\ 0 \end{pmatrix} + \begin{pmatrix} n_1 \\ n_2 \end{pmatrix}, \tag{6.2.1.1}$$

and

$$\mathbf{y}|s_1 = \begin{pmatrix} 0\\ \sqrt{E_b} \end{pmatrix} + \begin{pmatrix} n_1\\ n_2 \end{pmatrix}, \tag{6.2.1.2}$$
