Assembly Assignment

Mohamed Hamdan

August 2022

Problem Statement - **A sequential circuit has a single input x and a single output z. The input signal x can occur in groups of 1, 2 and 3 pulses. If x = 1 for one clock period, the output z will be 1 for three clock periods before returning to the starting state. If x = 1 for two clock periods, the output z will be 1 for two clock periods before returning to the starting state. If x = 1 for three clock periods, the output z will be 1 for a single clock period before returning to the starting state. Construct a state diagram and implement your design with D F F s . The circuit when designed acts as a pulse width adjuster.**

Hardware

Components

Component	Value	Count
Arduino	uno	1
Flip Flop	7474	2
LED	Red	1
Resistor	220ohm	1
Jumper wires	-	as required

Connections

The following connections are to be read as **IC-Name-IC-pin no:Arduino-pin no** :

- **IC7447(1)** - (1:5.5V), (2:8), (3:13), (4:5.5V), (5:2), (6:None), (7:Gnd), (8:None), (9:3), (10:5.5V), (11:13), (12:9), (13:5.5V), (14:5.5V)

- **IC7447(2)** - (1:5.5V), (2:10), (3:13), (4:5.5V), (5:4), (6:None), (7:Gnd), (8:None), (9:5), (10:5.5V), (11:13), (12:11), (13:5.5V), (14:5.5V)

Connect LED to pin 12 of arduino with the 220ohm resistor in series. Use pin 6 of arduino to input X.

State Diagram

The state diagram shown in 1 can be understood easily by grouping the states according to the clock pulse number. Consider one cycle of the state machine to contain three clock pulses numbered 1, 2 and 3. The states 0, 1 and 2 in the clock-1 group are the entry states to produce the Z values for the successive 2 clock pulses (clock-2 and clock-3). Distinct entry states are necessary in order to remember the input sequence of the previous cycle. While entering into any of these three states, the Z value for clock-1 is already determined by the input at clock-3 of the previous cycle. In order to keep track of the number of ones in the input sequence X and to output the proper values at Z (determined by the entry state), the remaining 7 states (3-9) are required.

Since the state diagram uses 10 states, the design requires 4 DFFs. Let the present state be denoted by $\mathbf{P} = P_3 P_2 P_1 P_0$ and the next state as $\mathbf{S} = S_3 S_2 S_1 S_0$ with X as input and Z as output.

Boolean expressions

The boolean expressions for **S** and Z are:

$$S_3 = P_2P_0' + P_2P_1'X' + P_2'P_1P_0X'$$
$$S_2 = P_2'P_1P_0' + P_2'P_1X + P_3'P_2'P_1'X' + P_2P_1'P_0X$$
$$S_1 = P_2'P_0X + P_1'P_0X + P_3P_0'X' + P_3'P_2'P_1'X + P_2'P_1P_0'X'$$
$$S_0 = P_3'P_2'X + P_2'P_0'X + P_2P_0'X' + P_2P_1X' + P_3'P_1'P_0X$$
$$Z = P_1P_0' + P_2P_0 + P_3P_0' + P_3X + P_3'P_1'P_0$$

Software

Make the connections and connect the arduino to the PC via USB. In the location of choice, type the below commands

1. svn co https://github.com/Muhammed-Hamdan/iith-fwc-2022-23/trunk/fwc_arduino_asm/asm_assignment

2. cd ide_assignment

3. pio run

4. pio run t upload
